

AutoDev 2.0

AI-Powered Software Engineering Platform

Describe any software project in plain English. AutoDev combines seven specialized AI agents — sharing one authoritative plan and API contract — with deterministic validation and consistency checking, to generate a structured, internally-consistent software project: backend, frontend, database, Docker config, tests, and documentation.

 **Start Generating**

 **Configure API Key**

BRING YOUR OWN PROVIDER

OpenAI

Anthropic

Groq

HuggingFace

Ollama (local)

**Planner Agent**

Analyzes your prompt and produces the authoritative plan: tech stack, API routes, entities, and env vars every other agent must follow.

**Database Agent**

Owens the canonical SQLAlchemy models — the single source of truth every other agent imports from, never redefines.

**Backend Agent**

Implements exactly the API contract from the plan — FastAPI or Flask routes, services, and business logic.

**Frontend Agent**

Generates React + Vite + TailwindCSS UIs that call exactly the backend's planned endpoints — no invented routes.

**DevOps Agent**

Generates Dockerfile, docker-compose.yml, .gitignore, and a complete .env.example matching the plan's env vars.

**Testing Agent**

Writes pytest suites covering every planned route — happy paths, validation errors, and edge cases.

**Documentation Agent**

Generates a full README — install steps, API reference, and env var docs — scoped to the real API contract.

**Validator Agent**

Parses every generated file (ast for Python, bracket-balance for JS) and reports structured, actionable syntax diagnostics.

**Consistency Checker**

Deterministic, zero-LLM pass verifying frontend calls, tests, README, Docker entry point, and requirements.txt all agree with the backend.

HOW IT WORKS

Your prompt → Planner (contract) → Database + Backend + Frontend → DevOps + Tests + Docs → Validator → Consistency Check → Project on disk
