511
Lines of Code

5
Agents Run

TECH STACK

Backend flask
Database postgresql

FEATURES

- JWT authentication
- user registration
- user login

SETUP INSTRUCTIONS

AI-generated - specific to this project

1 Navigate to project directory

```
$ cd C:\Users\HP\autodev-projects\flask_jwt_api
```

All subsequent commands will run from this directory

2 Create and configure environment file

```
$ copy .env.example .env
```

Edit .env and add your PostgreSQL connection string, JWT secret key, and other configuration values

3 Create Python virtual environment

```
$ python -m venv venv
```

```
$ venv\Scripts\activate
```

On macOS/Linux, use 'source venv/bin/activate' instead

4 Install dependencies

```
$ pip install -r flask_jwt_api/requirements.txt
```

This installs Flask, Flask-JWT-Extended, Flask-SQLAlchemy, psycopg2, and other required packages

5 Set up database with Alembic migrations

```
$ alembic upgrade head
```

Applies all pending migrations to create tables in PostgreSQL

6 Seed the database (optional)

```
$ python database/seed.py
```

Populates the database with initial test data if seed.py contains seed logic

7 Run tests

```
$ pytest tests/
```

Verify all tests pass before running the application

8 Start the Flask development server

```
$ python -m flask --app flask_jwt_api.main:app run --reload
```

The API will be available at http://localhost:5000. Use --debug flag for debugging mode

9 Alternative: Run with Docker

```
$ docker-compose up --build
```

This builds and runs the application in Docker containers. Ensure Docker is installed and running

ERROR

Docker entry point module 'app/main.py' not found in generated files

💡 Ensure BackendAgent creates app/main.py or update docker_entry_point in the plan

WARNING

Model 'User' defined in multiple files: ['database/models.py', 'flask_jwt_api/database/models.py']

💡 Keep 'User' only in database/models.py and import it everywhere else
